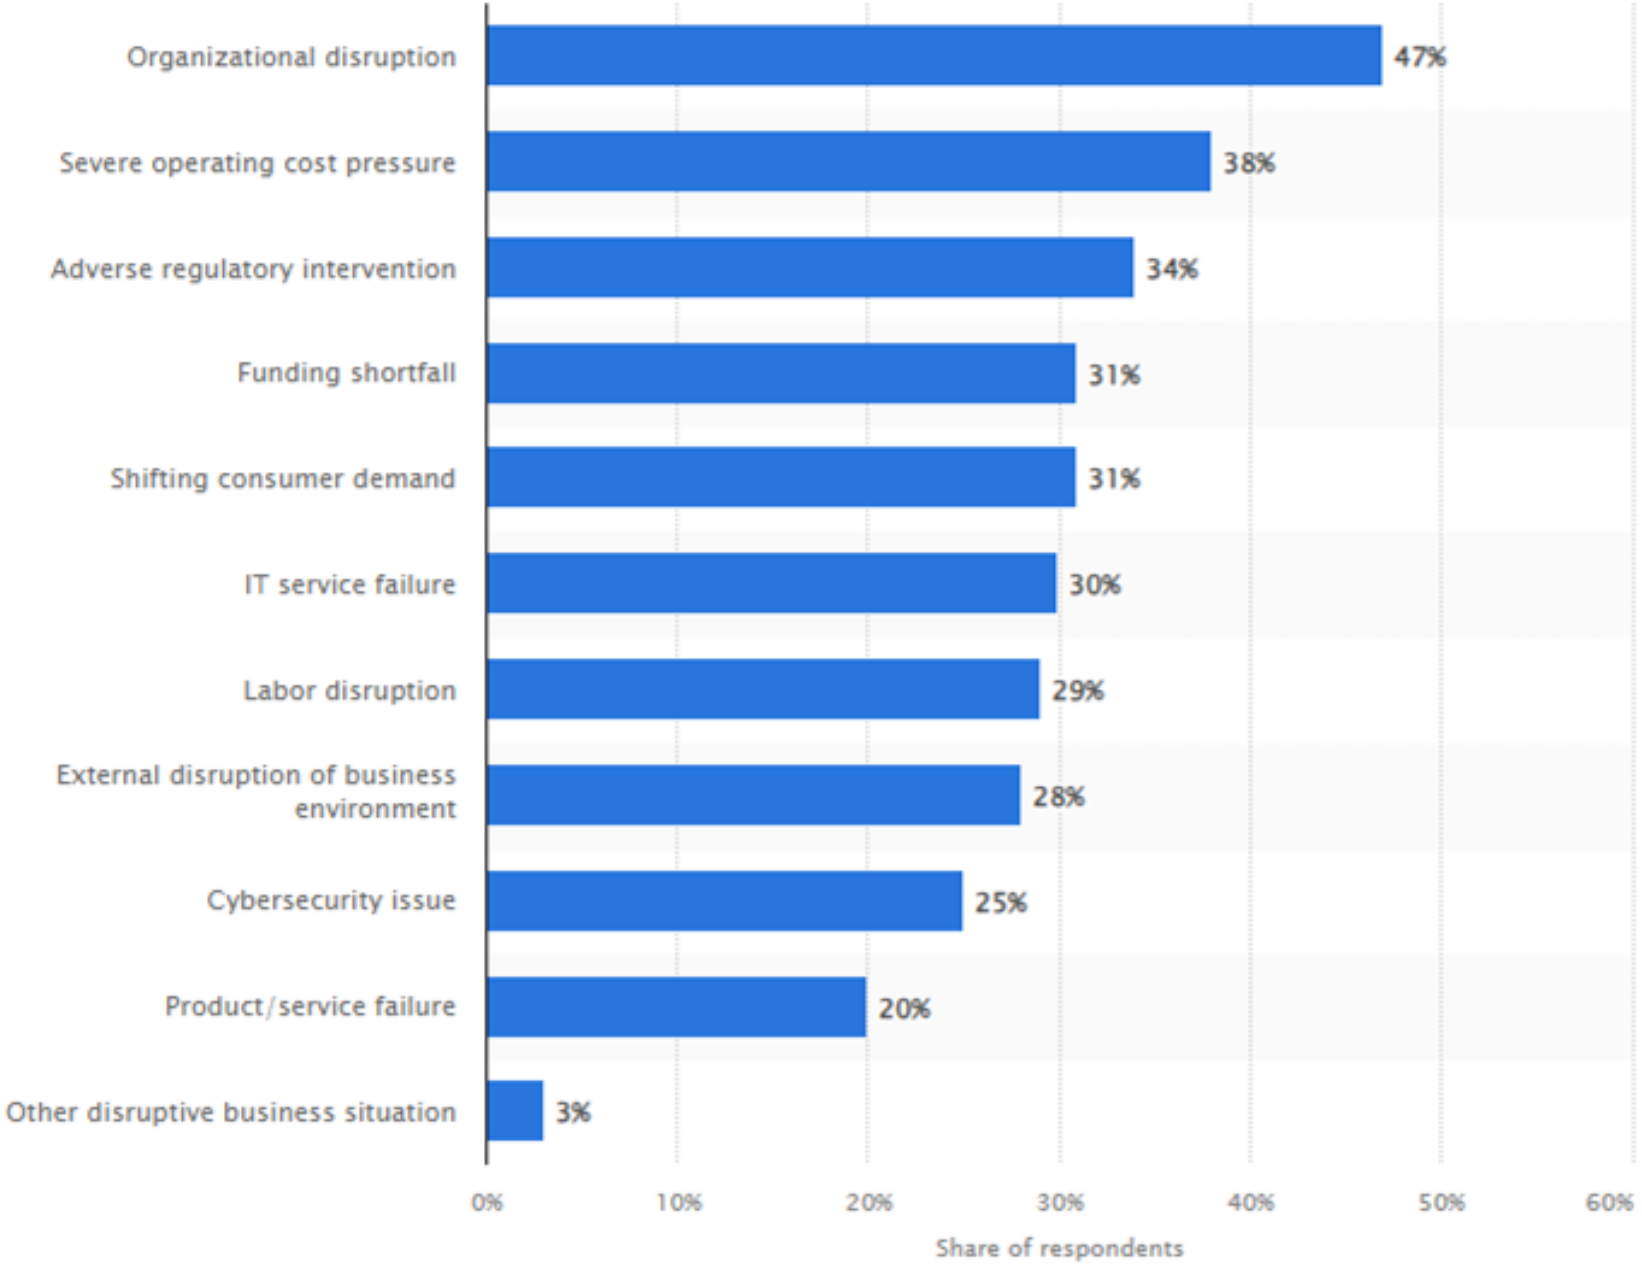
Introduction

Operational Challenges in Organizations

- Managing existing IS/IT solutions
- Implementing new IS/IT solutions
- Maintaining compatibility of new IS/IT solutions with existing ones
- Changing from one IS/IT solution to another
- Governing the increasingly volatile information flow
- Changing from one business process to another

impact the performance of organisations and somehow hinder competitiveness, sustainability, and profitability

Organization Challenges



Source: https://www.statista.com/statistics/1116156/challenges-faced-by-organizations-past-four-year/

EA: The Solution?

- The demand for ***better services*** by stakeholders and the general society is increasing at a rapid rate across the world
- Deployment of IS/ IT solutions to enable and support events, processes, and activities for the improvement and betterment of services to ***leverage sustainability and maintain competitive advantage***
- Enable IS/IT solutions to improve service delivery using EA as a ***guide*** *(Venkatesan & Sridhar, 2019; Zachman, 1996)*

Is EA always a *solution*?

Under what *conditions* might EA *fail* or *not be suitable*?

A Glance into an EA

- The concept of EA is not new; it has been evolving for more than three decades *(Gampfer et al., 2018; Zachman, 1987),* and it began to gain noticeable momentum in the late 1990s
- Since then, the concept has significantly grown in interest among scholars and practitioners
- The evolution of the concept reflects and can be viewed from three main angles:

Scholarly work from both teaching and research perspectives *(Ahlemann et al., 2021; Beese et al., 2022)*

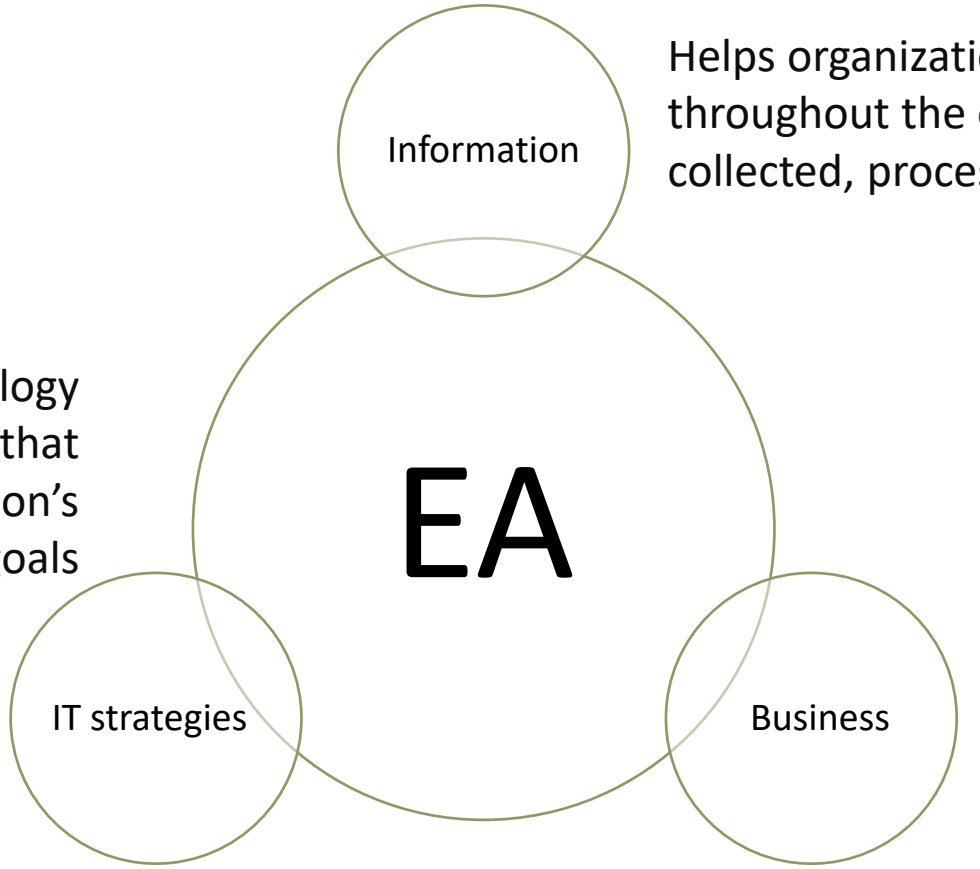
+

Deployment in public and private institutions *(Olsen, 2017)*

→

Frameworks that have emerged, such as The Open Group Architecture Framework (TOGAF), Gartner, Forrester, and the Federal Enterprise Architecture Framework (FEAF) *(Iyamu, 2022)*

A Glance into an EA



Helps organizations understand how information flows throughout the organization, including how it's collected, processed, stored, and shared

Considers the technology infrastructure and systems that support the organization's operations and goals

Looks at the broader business operations and goals of the organization.
It examines things like business processes, organizational structure, goals, and objectives

A Glance into an EA

- An approach intended to ***improve the management of business functions and governance of information systems and information technology (IS/IT) solutions*** of complex enterprises *(Zachman, 1987)*
- To ***address challenges that come with change***, particularly in the computing and business environments of an organisation that deploys it
- Thus, EA is viewed as a ***change agent*** because it facilitates change in ways that adequately consider new emerging paradigms and requirements that affect an organisation's goals and objectives *(Masuda et al., 2021)*
- EA focuses on ***change at both operational and strategic levels*** *(Georgiadis & Poels, 2021; Iyamu, 2015)*

What is **Enterprise Architecture**?

Enterprise

- Human endeavour, being enterprising
- There are always people collaborating, for a purpose supported by a platform
- The people: As a company, a business division, a project team
- The purpose: Commercial business, charity, government body, creative venture
- The support: Buildings, equipment and IT

Architecture

- Fundamental structure, a framework or design of something
- It is about designing and organizing the various components of an enterprise coherently and efficiently

EA is the Glue between BA and IA

Enterprise Architecture

Business Architecture

IT Architecture

IT is utilized to bring business value to organisations

The Concept of Enterprise Architecture

What is **Enterprise Architecture**?

….A collection of special documents (artifacts) describing various aspects of an organization from an integrated business and IT perspective intended to bridge the communication gap between business and IT stakeholders, facilitate information systems planning and thereby improve business and IT alignment.

Svyatoslav Kotusev

Tiko Iyamu

…..a blueprint that is developed, implemented, maintained, and used to explain and guide how IS/IT, information management, and business processes can be used efficiently to accomplish the goals and objectives of an organization.

….the practice of analyzing, designing, planning, and implementing enterprise analysis to successfully execute on business strategies.

CIO Magazine

EA is especially useful for large businesses undergoing *digital transformation* because it focuses on bringing legacy processes and applications together to form a more seamless environment

Quick Discussion

1. Why have Celcom and Digi merged?

We have merged to build a stronger company for our customers, now and in the future. Our new company will combine the best of both of us: our networks, distribution channels, products and services, partners, and our people to bring consumers and businesses the best in connectivity, service, innovation and value.

Based on the above statement,

1. How can you use EA to ensure a merged company effectively combines the best parts of both organizations?
2. What parts of EA must you focus on to ensure the new company provides better connectivity, service, innovation, and value to customers and businesses?

The Essence of Enterprise Architecture

- Enterprise architecture provides ***effective instruments*** facilitating communication, collaboration and mutual understanding between different groups of actors
- Using EA documents for supporting discussions helps ease communication problems resulting from disparate knowledge, interests and goals of various involved actors
- Essentially, enterprise architecture can be considered as a ***communication medium*** between diverse business and IT stakeholders in organisations
- Many organisations employ EA, standardise IS/IT solutions, and harmonise their efforts to avoid unnecessary redundancies and inconsistencies
- EA is guided by the organization's business requirements — it ***helps lay out how information, business, and technology flow together***

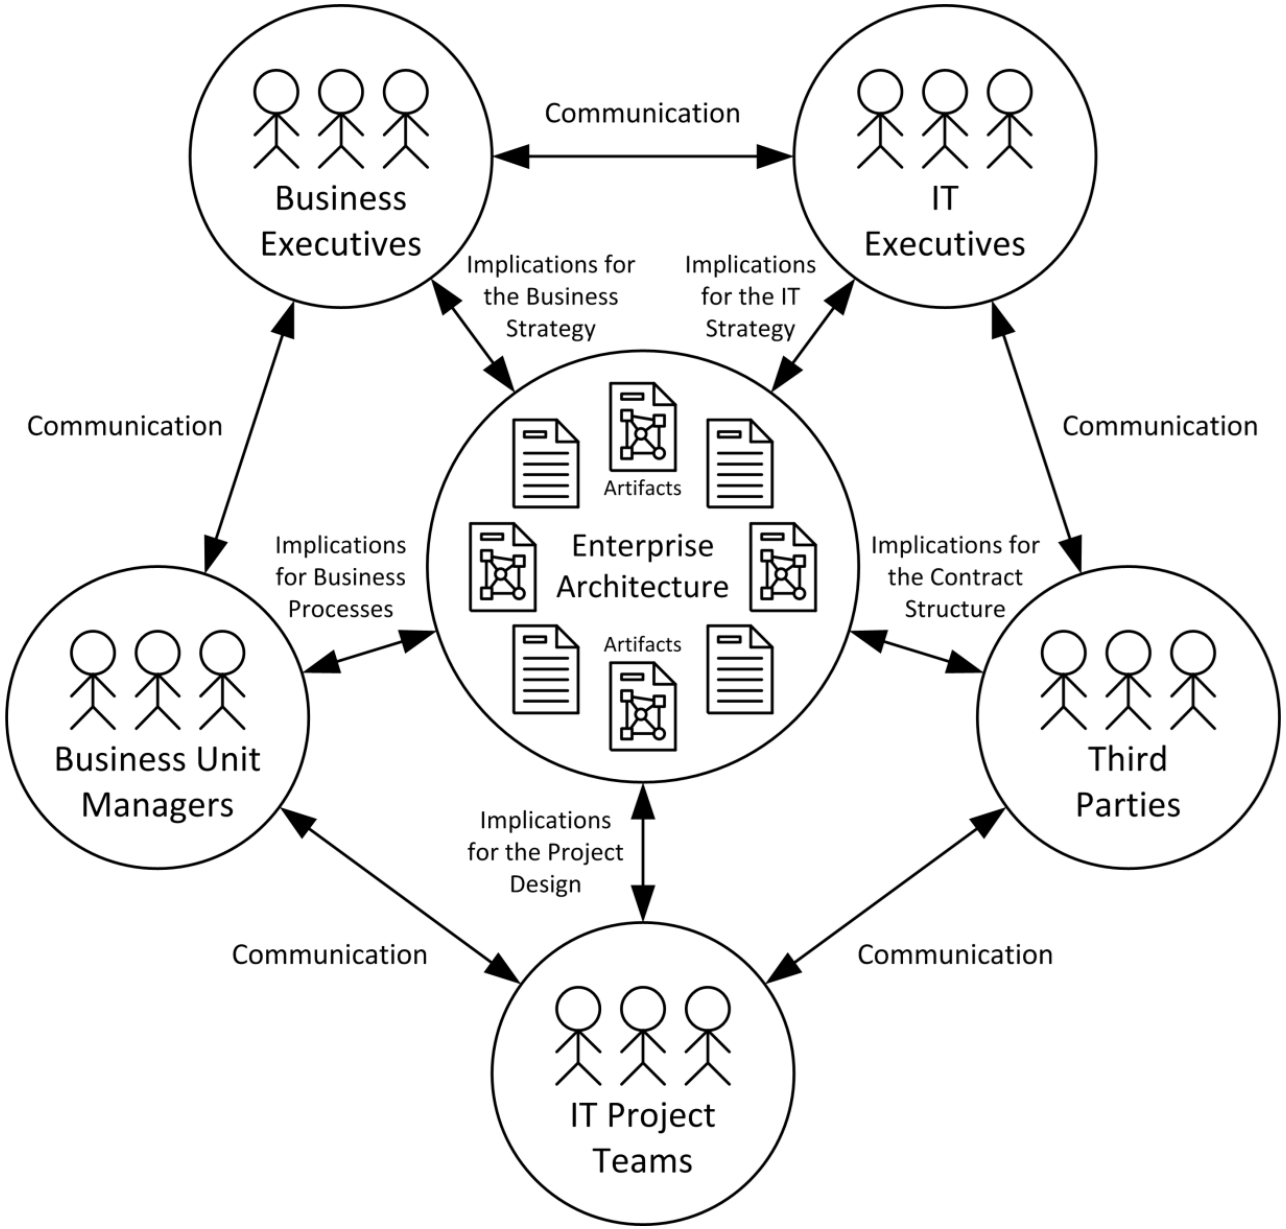
EA: Instrument for Communication



Specifics of Enterprise Architecture

- Enterprise architecture does not have much in common with building architecture
- Organizations as dynamic socio-technical systems cannot be designed or engineered and then built
- Organizations are ***extremely complex, organic*** and living entities that gradually evolve over time
- Enterprise architecture is a pragmatic set of descriptions useful for managing the evolution of organizations
- The term “enterprise architecture” is purely ***metaphorical*** and is only an umbrella term for multiple diverse documents used for information systems planning
- EA doesn’t include a formal documentation structure; instead, it’s intended to offer a more ***holistic view of the enterprise***

EA Domains

Domains of Enterprise Architecture

Business

customers, capabilities, processes, roles, etc.

Applications

programs, systems, custom software, vendor products, etc.

Data

data entities, structures, sources, etc.

Integration

interfaces, connections, interaction protocols, integration platforms, etc.

Infrastructure

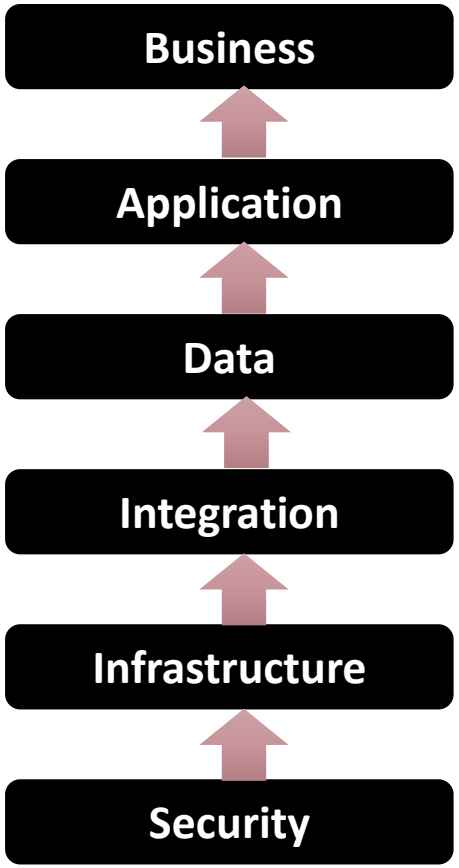
hardware, servers, operating systems, networks, etc.

Security

firewalls, authentication mechanisms, identity and access management systems, encryption, etc.

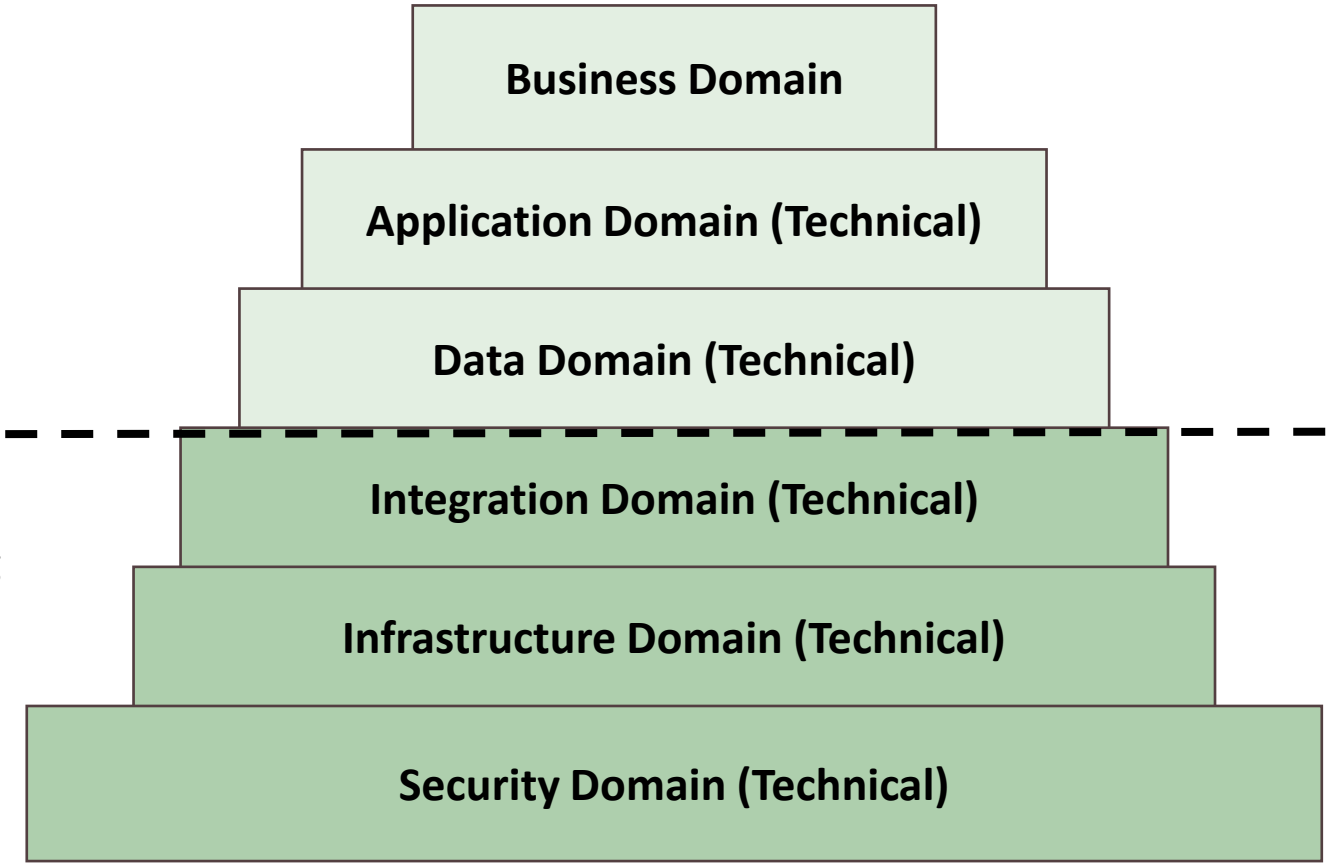
EA Domains as a Stack

- The set of common EA domains can be represented as a multilayered stack of domains, where lower layers underpin higher layers:
  - ✓ Applications automate business processes
  - ✓ Data is used by applications
  - ✓ Integration mechanisms link all applications and data together
  - ✓ Infrastructure hosts all applications, databases and integration platforms
  - ✓ Security mechanisms permeate all other EA domains
- The business domain is non-technical in nature, while all other EA domains are technical domains directly related to respective technologies



Enabling and Supporting EA Domains

Business-Enabling
(Functional)
EA Domains



Business-Supporting
(Non-Functional)
EA Domains

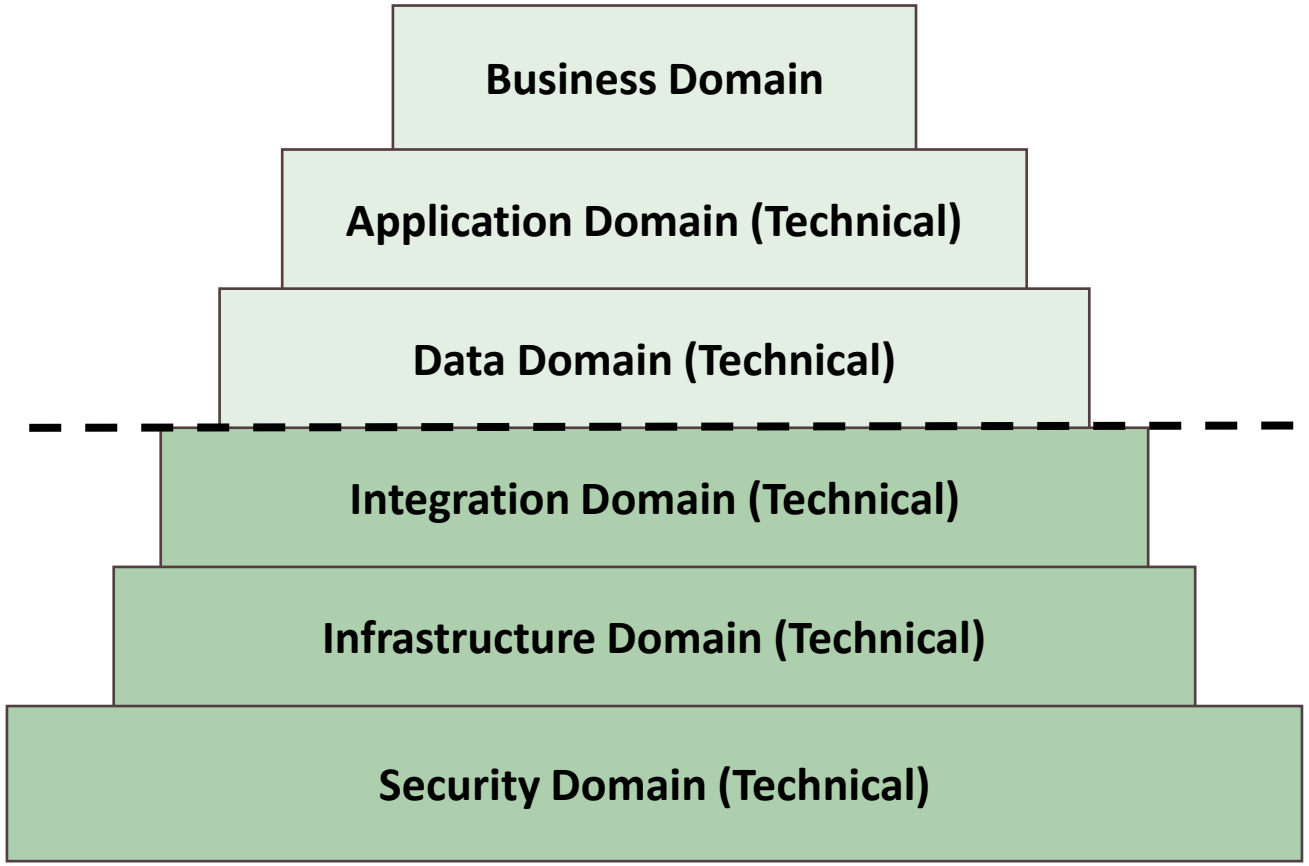
Define the core business functionality provided by IT systems

Relevant and visible to most business stakeholders

Unrelated to the business functionality provided by IT systems

Irrelevant and invisible to most business stakeholders

Enabling and Supporting EA Domains



Help the business achieve its goals
Sales, marketing, customer services and product development

Support the overall operation and management of IT systems
Security, infrastructure, data management, system performance

Enabling and Supporting EA Domains

- All EA domains can also be separated into business-enabling domains and business-supporting domains
- ***Business-enabling*** EA domains occupy the ***top layers of the stack*** and represent functional domains
  - These domains are relevant to business stakeholders and define the core business functionality of IT systems
- ***Business-supporting*** EA domains occupy the ***bottom layers of the stack*** and represent non-functional domains
  - These domains are irrelevant to business stakeholders and unrelated to the business functionality of IT systems

The Practice of EA for Improving Business and IT Alignment

The Practice of Enterprise Architecture

- The practice of enterprise architecture, or simply an EA practice, is an organizational practice of using specific documents called ***EA artefacts*** for improving communication between business and IT stakeholders, facilitating information systems planning and improving business and IT alignment
- An EA practice:
  - ✓ involves everything related to a company's structure, including its people, processes, and software, and how they work together
  - ✓ affects the whole organization, involves many people, and changes how IT decisions are made

An EA Practice and Organization

- An ***EA practice*** is not a separate standalone activity, but rather an ***integral part*** of the organizational organism
- An EA practice requires integration with other organizational processes, most importantly with strategic management and project management
- The role of an EA practice is to translate abstract business considerations into the designs of specific IT solutions implementing these considerations

An EA Practice and Other Processes

The ***strategic management*** process takes relevant information from the external business environment as an input and produces abstract business considerations guiding an organization as an output

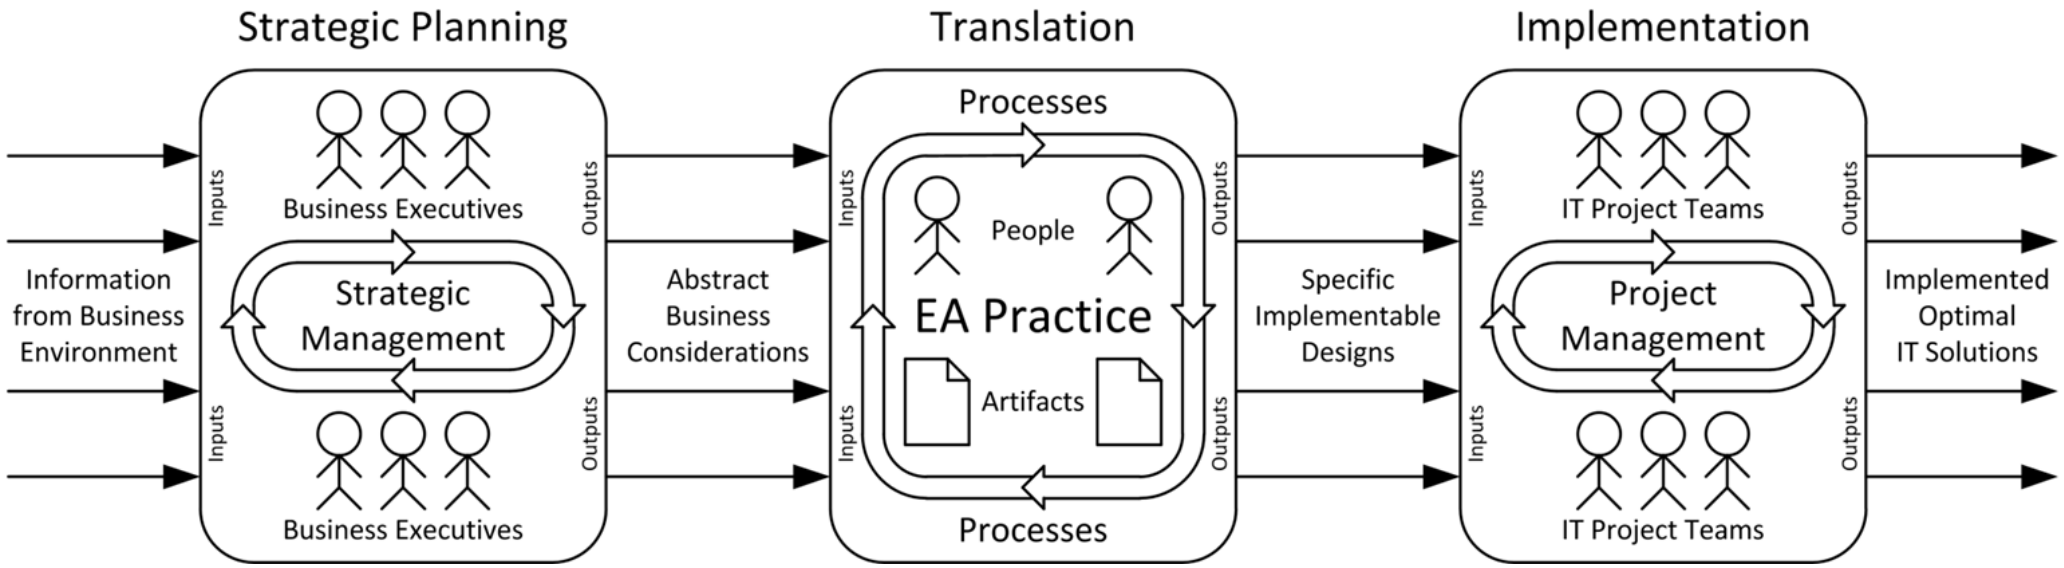
An EA practice takes these abstract business considerations as an input and produces specific implementable designs of IT solutions as an output

The ***project management*** process takes these implementable designs as an input and produces optimal IT solutions corresponding to these designs as an output

All these processes are ***continuous***, carried out simultaneously and imply constant feedback

The Position of an EA Practice

- As a mediator between strategic management and projects management, an EA practice enables *effective coordination of **plans** and **activities** between all relevant actors* involved in strategic decision-making and implementation of IT systems resulting in improved business and IT alignment



EA Artefacts

Enterprise Architecture Artefacts

EA artefacts:

1. Provide ***descriptions*** of an organisation from different perspectives important for the various actors involved in strategic decision-making and implementation of IT systems
2. Can be very ***diverse*** and ***differ*** in their informational contents, general meanings and lifecycles

An EA practice involves using specific EA artefacts to facilitate communication among various stakeholders.

What's Inside EA Artefacts?

Representation formats

textual, graphical and tabular formats or a mix of these formats

Levels of detail

range in their granularity from very high-level abstractions to pretty low-level details

Organizational scopes

range from entire organizations and lines of business to separate change initiatives and IT projects

EA domains

business, applications, data, integration, infrastructure and security domains as well as their combinations

Temporal states

current state (now), short-term future state (<1 year), mid-term future state (2-3 years), long-term future state (3-5 years), stateless and their combinations

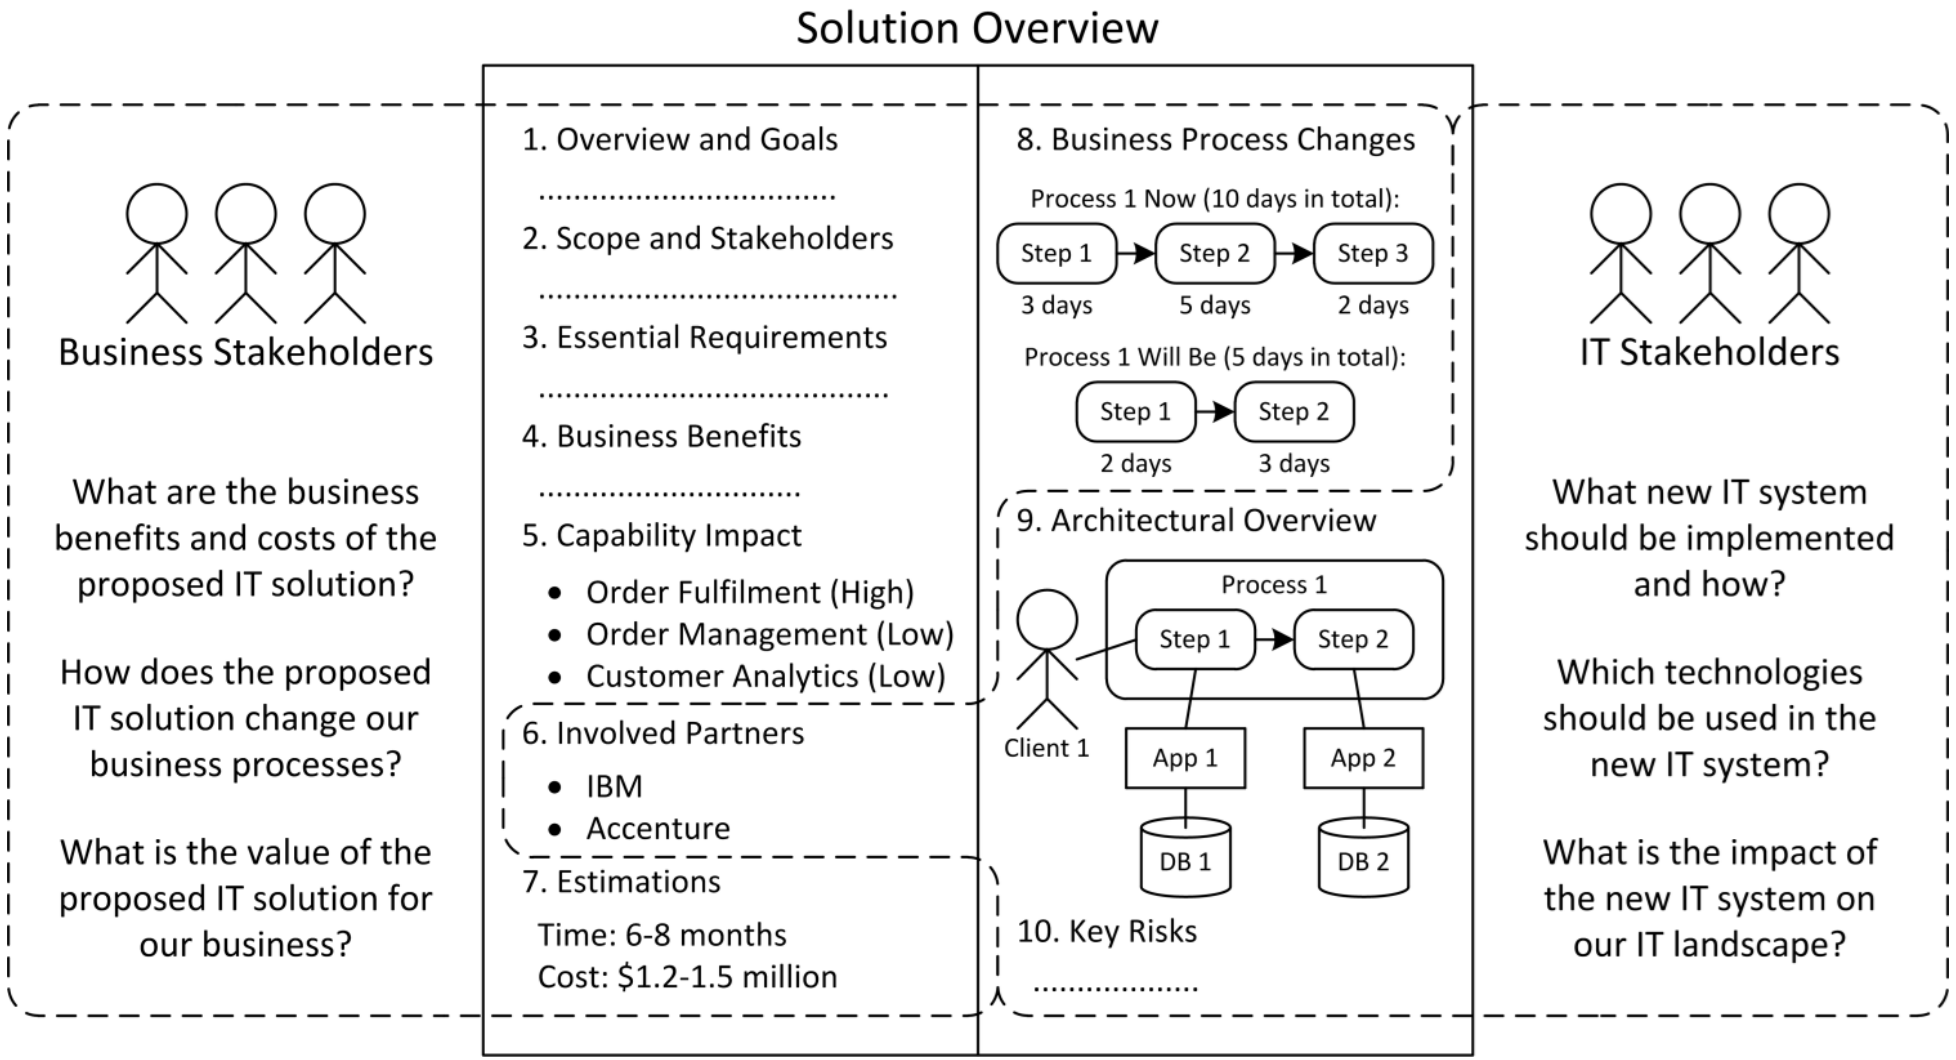
Duality of EA Artefacts

- **Duality of EA artefacts** implies that the information provided by these artifacts ***is relevant to two different audiences simultaneously***, satisfies the information needs of both these audiences and presented in a convenient format appealing to both audiences
- Duality allows using EA artefacts as a means of communication between different groups of actors

Explicit duality is when ***different*** parts of EA artefacts are relevant to different groups of actors

Implicit duality is when ***same*** parts of EA artefacts are interpreted differently by different actors

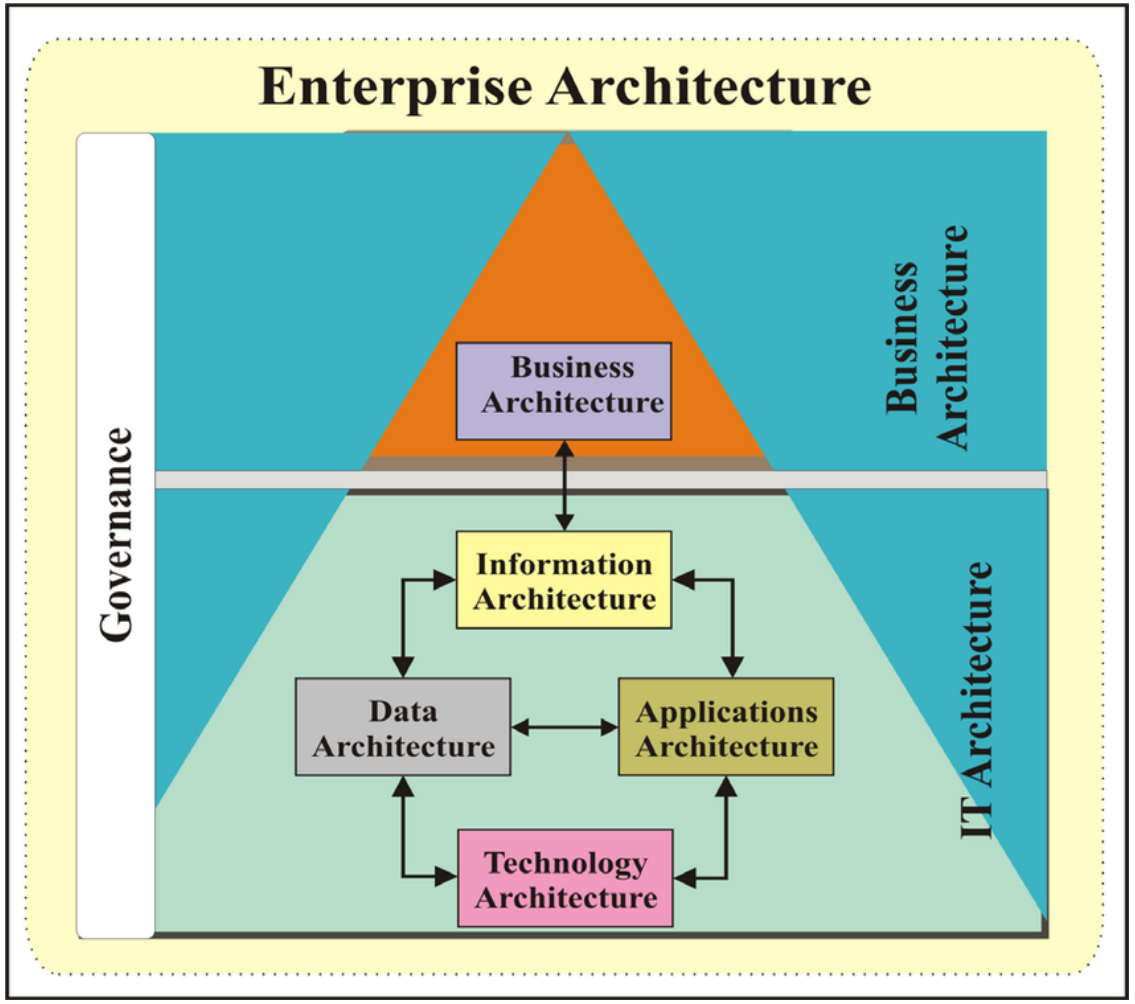
Example of a Dual EA Artefact



Example of a Dual EA Artefact

Explicit duality

Different parts of EA artifacts are relevant to different groups of actors



Different - Different

Business Processes: On the other hand, business stakeholders such as department heads, operations managers, and executives are more interested in the business process aspect of the EA artifacts. They focus on ***understanding how various business functions are interconnected, how data flows between different departments, and how workflows can be optimised to improve efficiency and customer satisfaction***. This part of the EA artifacts helps them align business objectives with IT capabilities.

IT Architecture: The IT department is primarily concerned with the technical architecture portion of the EA artifacts. This includes ***server configurations, network topology, software platforms, and security protocols***. For them, this part of the EA artifacts is crucial for ensuring that the organisation's IT infrastructure is robust, scalable, and secure.

Example of a Dual EA Artefact

Implicit duality

Same parts of EA artefacts are interpreted differently by different actors

Same - Different

IT Department Interpretation: The IT department interprets the customer data management section of the EA artifacts primarily ***from a technical perspective***. They focus on ***database schemas, data storage solutions, encryption methods***, and API integration for accessing customer data across various systems. For them, the emphasis is on ensuring data security, scalability, and interoperability of IT systems.

Marketing Department's Interpretation: Conversely, the marketing department views the same customer data management section through a lens focused on ***customer insights and campaign effectiveness***. They are interested in understanding ***how customer data can be leveraged to personalize marketing messages, segment customers effectively, and measure the success of marketing campaigns***. Their interpretation emphasizes the usability and relevance of customer data for driving revenue and enhancing customer satisfaction.

Two Meanings of EA Artefacts

- From the perspective of their general meaning in an EA practice all EA artefacts can be separated into decisions EA artefacts and facts EA artefacts

Decisions: EA artefacts represent made ***planning decisions***, i.e. achieved and formalized agreements between various stakeholders regarding the desired future course of action

Facts: EA artefacts represent documented ***objective facts***, i.e. reflections of the actual current situation in an organisation as it is

Decisions EA Artefacts

- Decisions EA artefacts may represent these decisions:
  1. **HOW** an organisation needs to work from the IT perspective
  2. **WHERE** an organisation should invest its IT dollars
  3. **HOW** a particular IT solution should be implemented

- They always have certain implications for the future
- These EA artefacts are **always developed or updated *collaboratively*** by all relevant stakeholders
- After decisions EA artefacts are created and approved, all stakeholders should **act according to these decisions**
- All EA artifacts describing the future, and all stateless EA artefacts, can be considered as decisions EA artefacts

Examples of Decisions EA Artefacts

Decision Matrices

evaluate and compare different options or alternatives based on predefined criteria.

Decision Trees

a tree-like structure where each node represents a decision point, and branches represent possible outcomes or choices

Impact Analysis

outlines the potential impacts of a decision on various aspects of the enterprise

Business Cases

focusing on the expected benefits, costs, risks, and alignment with strategic objectives

Risk Assessments

risks to the organization's goals, operations, security, compliance, and other relevant factors

Facts EA Artefacts

- Facts EA artefacts may document these facts:
  1. **WHAT** technologies the organizational IT landscape uses
  2. **WHAT** IT assets an organization possesses, runs and maintains
  3. **HOW** the existing IT systems and databases are interconnected

- They have **NO implications** for the future
- These EA artefacts may be developed or updated solely by specific actors
- After facts EA artefacts are created, they can be used by any actors as reference materials for planning purposes
- All EA artefacts describing only the current state can be considered as facts EA artefacts

Examples of Facts EA Artefacts

Business Capability Maps

help architects understand the organization's functional structure and identify areas for improvement or optimization

Process Models

help architects analyze and optimize business processes to enhance efficiency and effectiveness

Application Portfolios

list and categorize the organization's software applications, including their functionalities, technologies, vendors, and usage

Technology Inventories

capture details such as system configurations, versions, licenses, and dependencies

System Interface Catalogue

document the interfaces between different systems or components within the organization's IT environment

Organisational Structure Diagrams

depict the organization's hierarchical structure, including departments, teams, roles, and reporting relationships

Decisions and Facts EA Artefacts

Artifacts	Decisions EA artifacts	Facts EA artifacts
State	Either the future state or stateless	Only the current state
Represent	Made planning decisions	Documented objective facts
Implications	Always have implications for the future	Have no implications for the future
Developed	Collaboratively by all stakeholders	Solely by specific actors
Format	Optimized for productive teamwork, ease of editing and distribution	Optimized for long-term storage, searchability and analysis of information
Nature	Subjective, i.e. based on the interests and opinions of specific people	Objective, i.e. based on acknowledged facts and independent of specific people
Role	Primary, i.e. provide instruments for communication, decision-making and planning	Supporting, i.e. provide the information base required for developing decisions EA artifacts
Purpose	Help make optimal planning decisions	Help store the facts important for IT planning
Outcome	Stakeholders act according to the made decisions	Can be used by any actors as reference materials

Two Lifecycles of EA Artefacts

- From the perspective of their lifecycles in an EA practice all EA artefacts can be separated into permanent EA artefacts and temporary EA artefacts

✓ **Permanent EA artefacts** are long-lived EA artefacts often existing for many years

✓ **Temporary EA artefacts** are short-lived EA artefacts often existing for several months or even weeks

Permanent EA Artefacts

- Permanent EA artefacts live and evolve together with an organization
- They are ***created once*** and then updated when necessary, according to the ongoing changes in an organization and its business environment
- After being developed these EA artefacts are ***constantly used, continuously maintained*** and occasionally discarded when become irrelevant
- Most EA artefacts covering wider scopes beyond specific IT initiatives or projects tend to be permanent EA artefacts

Temporary EA Artefacts

- Temporary EA artefacts are transitory, ***single-purposed and disposable***
- They are ***created at specific moments for purposes***, ***used*** as ***intended*** and then ***immediately*** discarded or archived
- Due to their short lifespan, the very need to update or maintain temporary EA artifacts is usually absent
- All EA artefacts covering narrow scopes (e.g. separate IT initiatives or projects) tend to be temporary

Permanent and Temporary EA Artefacts

Artifacts	Permanent EA artifacts	Temporary EA artifacts
Scope	Wide scope, beyond specific IT initiatives	Narrow scope, limited to specific IT initiatives
Lifespan	Long-lived, often exist for years	Short-lived, exist for months or even weeks
Usage	Created once, periodically updated, constantly used and occasionally discarded	Created for particular purposes, used as intended and then immediately discarded

Permanent and Temporary EA Artefacts

Permanent EA

- ✓ Enterprise Architecture Principles
- ✓ Reference Architectures
- ✓ Core Business Processes
- ✓ Governance Frameworks

Temporary EA

- ✓ Technology Assessments
- ✓ Interim Solutions
- ✓ BRS
- ✓ SRS
- ✓ DRS

Examples of EA Artefacts

EA Artifact	Principles	Landscape Diagram	Solution Design
Example	Principle 1: Standardized Business Processes Statement: ..... Rationale: ..... Implications: ..... Principle 2: Single Customer View Statement: ..... Rationale: ..... Implications: ..... Principle 3: Business Continuity Statement: ..... Rationale: ..... Implications:		Description	General imperatives defining how the whole organization needs to work, updated on a yearly basis	A snapshot of the current IT landscape in a specific business function, maintained up-to-date	A detailed technical description of a specific IT project which is going to be implemented shortly

Lifecycle	Permanent	Permanent	Temporary

Permanent and Temporary EA Artefacts

e-commerce

PERMANENT

- **Business Capability Map**
  - ✓ outlines long-term capabilities essential for its operations, such as “Order Management”, “Inventory Management”, “Payment Processing”, and “Customer Support”
- **Application Portfolio**
  - ✓ catalogues core systems and platforms critical for its business operations, such as the e-commerce website, inventory management system, customer relationship management (CRM) system, and payment gateway
- **Technology Standards and Guidelines**
  - ✓ governing the selection, deployment, and management of IT infrastructure and software solutions

TEMPORARY

- **Prototype of a New Mobile App Feature**
  - ✓ short-lived, existing for several weeks or months during the exploration and validation phase before the feature is either integrated into the production environment or discontinued
- **Temporary Process Model for Black Friday Sales**
  - ✓ a short-term business initiative and may undergo rapid iterations or modifications leading up to and during the event before being archived or retired post-sales
- **Proof of Concept for Blockchain-Based Supply Chain Tracking**
  - ✓ limited lifespan, existing for a few months as part of a focused experiment to evaluate the technology’s potential benefits and challenges before a decision is made

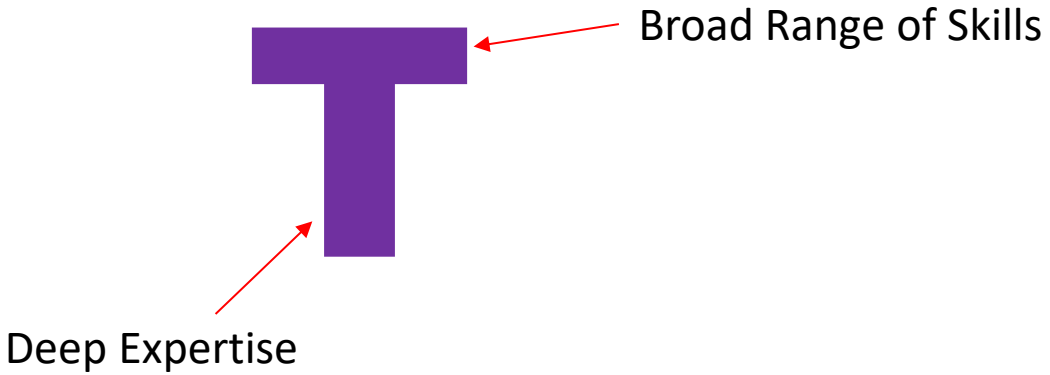
EA Architect

The Role of Architects in an EA Practice

- The critical **actors** of an EA practice are **architects**
- **Architects** act as **chief IT planners** in organisations
- Ideal architects are effective communicators, team players, innovators and systems thinkers knowledgeable in both business and IT
- Architects are “T-shaped” professionals in connecting business and IT, i.e., specialists in finding optimal IT strategies and solutions satisfying business strategies and needs



We are currently assisting our client to source for potential candidate to fill in the role as **The Lead Solutions Architect.** This is a critical role responsible for designing and implementing cutting-edge IT solutions that align with our clients' business objectives. This position involves leading solution design, architecture, and integration efforts, providing expert consulting services, and optimizing business processes through innovative technology solutions. The ideal candidate will possess a strong background in solution architecture, infrastructure design, and technical consulting, with a proven ability to deliver complex projects and present to senior leadership.

Solution Architect Lead

Key Responsibilities:

- **Solution Design & Architecture:** Lead the design and architecture of comprehensive IT solutions, ensuring alignment with client requirements, industry best practices, and client's strategic objectives.
- **Consulting Services:** Provide expert consulting to clients, offering technical guidance and recommendations to address business challenges and enhance operational efficiency.
- **System Integration:** Oversee the integration of complex systems and applications, ensuring seamless interoperability and optimal performance across various platforms.
- **Pre-Sales Support:** Collaborate with the sales team to develop and present compelling technical proposals and solutions that address client needs, driving business growth and customer satisfaction.
- **Technology Expertise:** Leverage deep expertise in IBM HW Product Suite and other relevant technologies to deliver high-quality solutions that meet client expectations and industry standards.
- **Business Process Optimization:** Analyze and optimize business processes through the application of innovative IT solutions, enhancing efficiency and supporting digital transformation initiatives.
- **Stakeholder Collaboration:** Work closely with internal and external stakeholders, including C-suite executives, to ensure clear communication, alignment of objectives, and successful project delivery.
- **Project Leadership:** Lead cross-functional teams in the execution of solution architecture projects, ensuring adherence to timelines, budgets, and quality standards.
- **Continuous Improvement:** Stay current with industry trends, emerging technologies, and best practices in solution architecture and IT consulting, applying this knowledge to continuously improve client's service offerings.

General Responsibilities of Architects

- ***Communicating*** with various business and IT stakeholders and understanding their concerns
- ***Facilitating*** the dialogue and conversation between different stakeholders
- ***Finding, proposing and discussing*** optimal planning decisions satisfying the concerns of stakeholders
- ***Developing and updating*** EA artefacts for supporting discussions and documenting the achieved agreements
- ***Establishing*** and maintaining a repository of EA artefacts
- ***Establishing, running and optimising*** EA-related processes

Architects as Developers of EA Artefacts

- Architects are the ***key developers*** of all EA artifacts
- Architects are responsible for involving relevant stakeholders, collecting necessary data and completing all other activities required to develop EA artifacts
- However, the typical process of developing and updating EA artifacts differs significantly for decisions EA artefacts and facts EA artefacts

Developing DECISIONS EA Artefacts

- The development and update of decisions EA artifacts is a complex, creative and tricky process
- Decisions EA artifacts are always developed ***collaboratively* by architects and their stakeholders**
- Essentially, the collaborative development of decisions EA artifacts is the **actual process of IT planning**
- Even though architects usually act as facilitators or drivers of their development, fundamentally decisions EA artifacts are products of a **collective teamwork**
- Decisions EA artifacts are normally created in a ***proactive manner***

Developing FACTS EA Artefacts

- The development and update of facts EA artifacts is a ***more simple, routine and straightforward process***
- Facts EA artifacts may be developed ***by individual architects*** alone or with only minimal involvement of other actors
- Facts EA artifacts are often created in a ***reactive manner*** on an as-necessary basis

Processes for Developing EA Artefacts

Decisions EA Artifacts

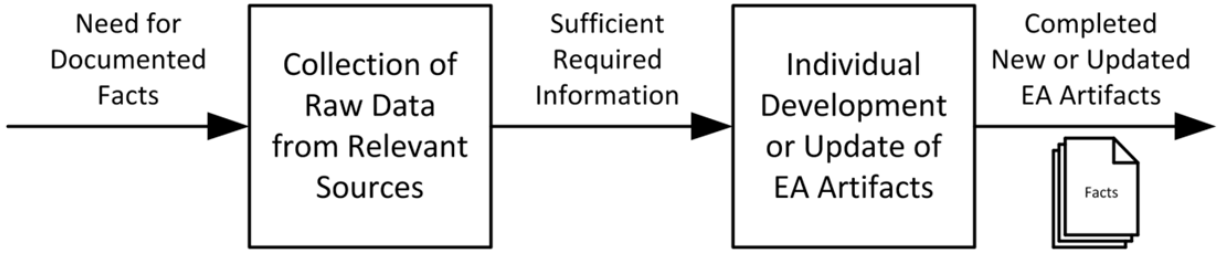
(Represent made planning decisions)

Developed: Collaboratively by all stakeholders
Architects: Act as drivers and facilitators
Process: Complex, creative and politicized

Value: Realized during the development process
Priority: Process over product
Success Factor: Involvement of all stakeholders

Facts EA Artifacts

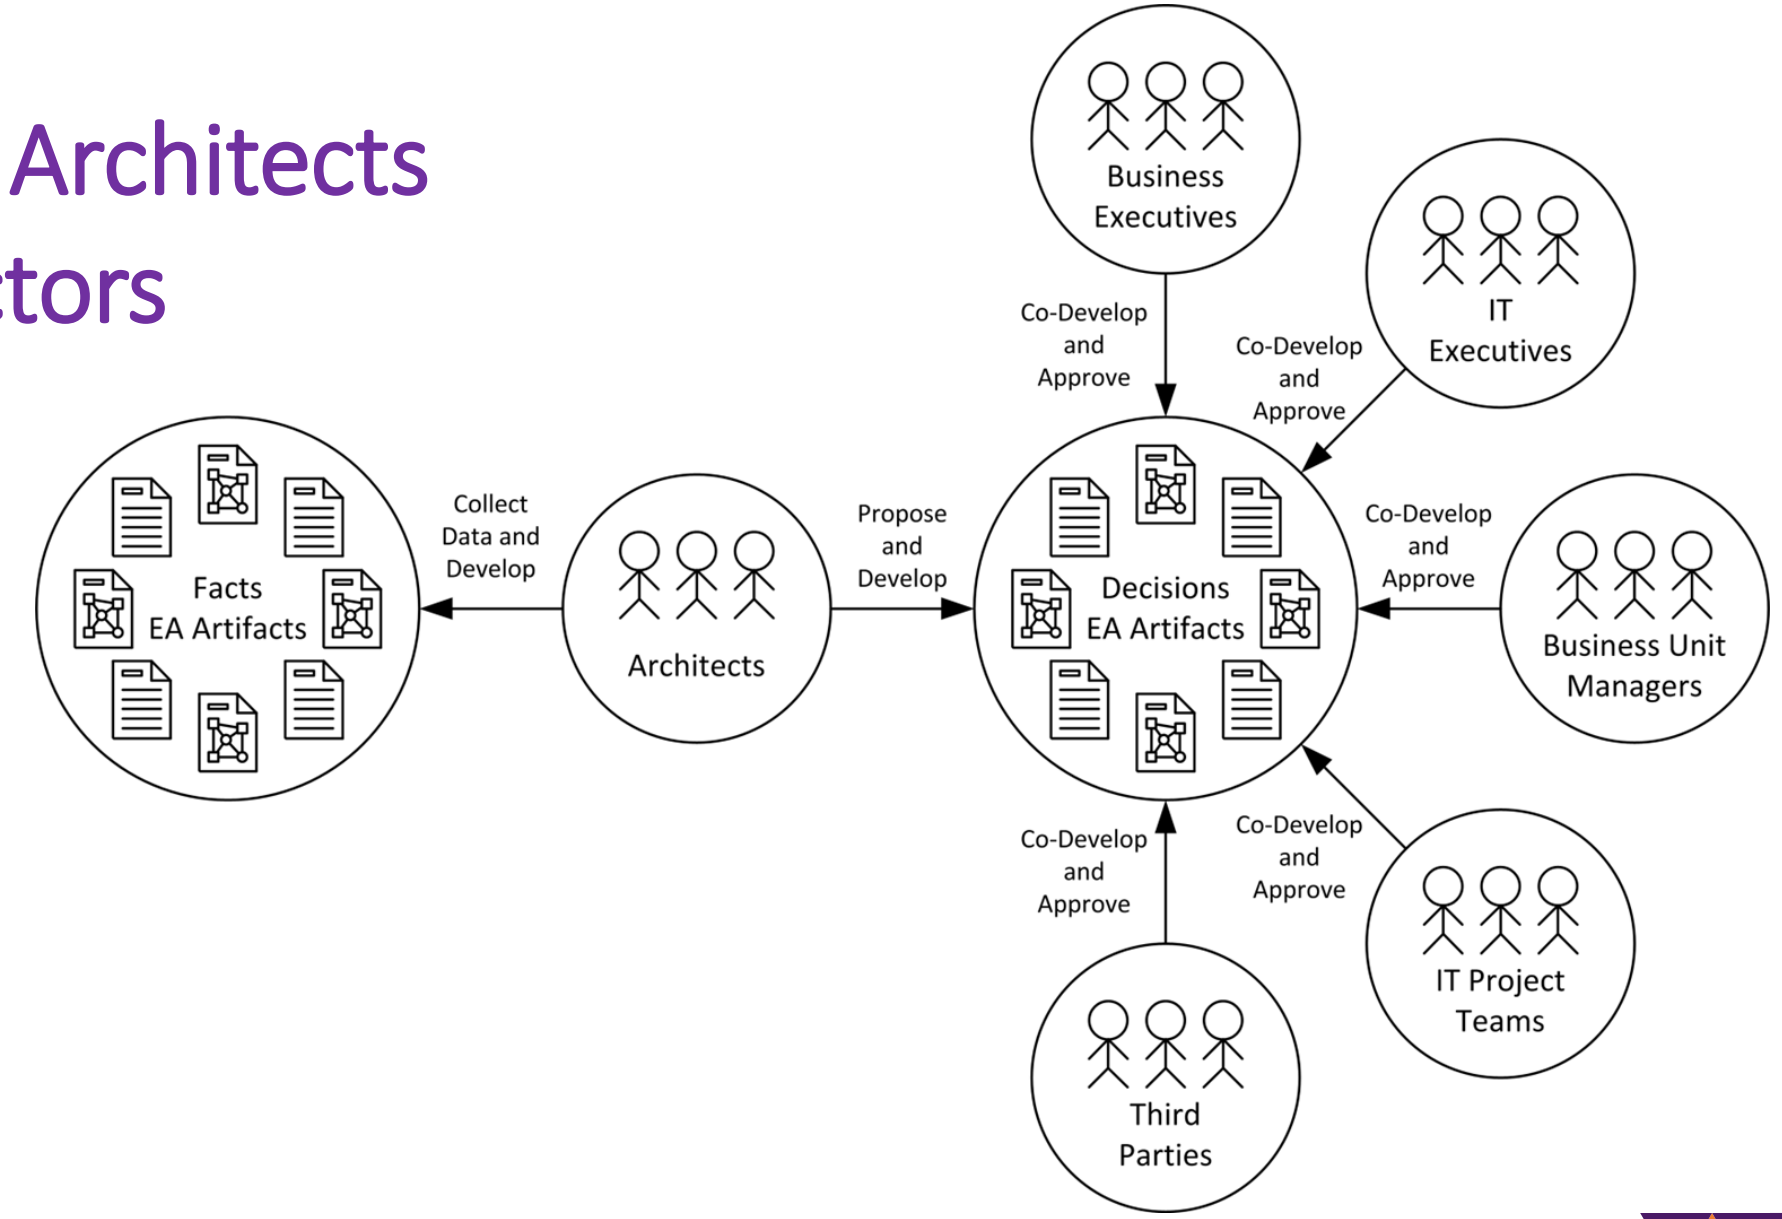
(Represent documented objective facts)



Developed: By individual architects alone
Architects: Act as sole developers
Process: Straightforward and routine

Value: Realized after development is completed
Priority: Product over process
Success Factor: Accuracy of all descriptions

EA Artefacts, Architects and Other Actors



Architecture Functions in Organizations

- An EA practice is implemented by an ***architecture function***
- An architecture function is a ***separate organisational function*** usually reporting to the CIO and responsible for an EA practice and organization-wide IT planning
- An architecture function can be considered a ***specialised planning subunit of the IT department***
- The main purpose of an architecture function is to enable and support primary activities, e.g., production and sales

EA General Goals

1. ***Effectiveness***. EA establishes a workflow for essential and accurate processes. An EA blueprint defines how to reach the deliverables set out by the business.
2. ***Efficiency***. The ability to reuse resources and eliminate redundancies is clearly set out within the framework. Business process modelling and workflow mapping can produce greater collaboration.
3. ***Agility***. Organisations look to EA to make sense of combining legacy technology and adoption of new technology. A correct model will assess technology risks and guide the monitoring, metrics, and analysis needed to identify when and how to evolve IT in alignment with business goals.
4. ***Continuity***. Nothing is more important to leading enterprises than being able to maintain mission-critical business operations. EA allows for the highest level of continuity through standardisation of business and IT processes.
